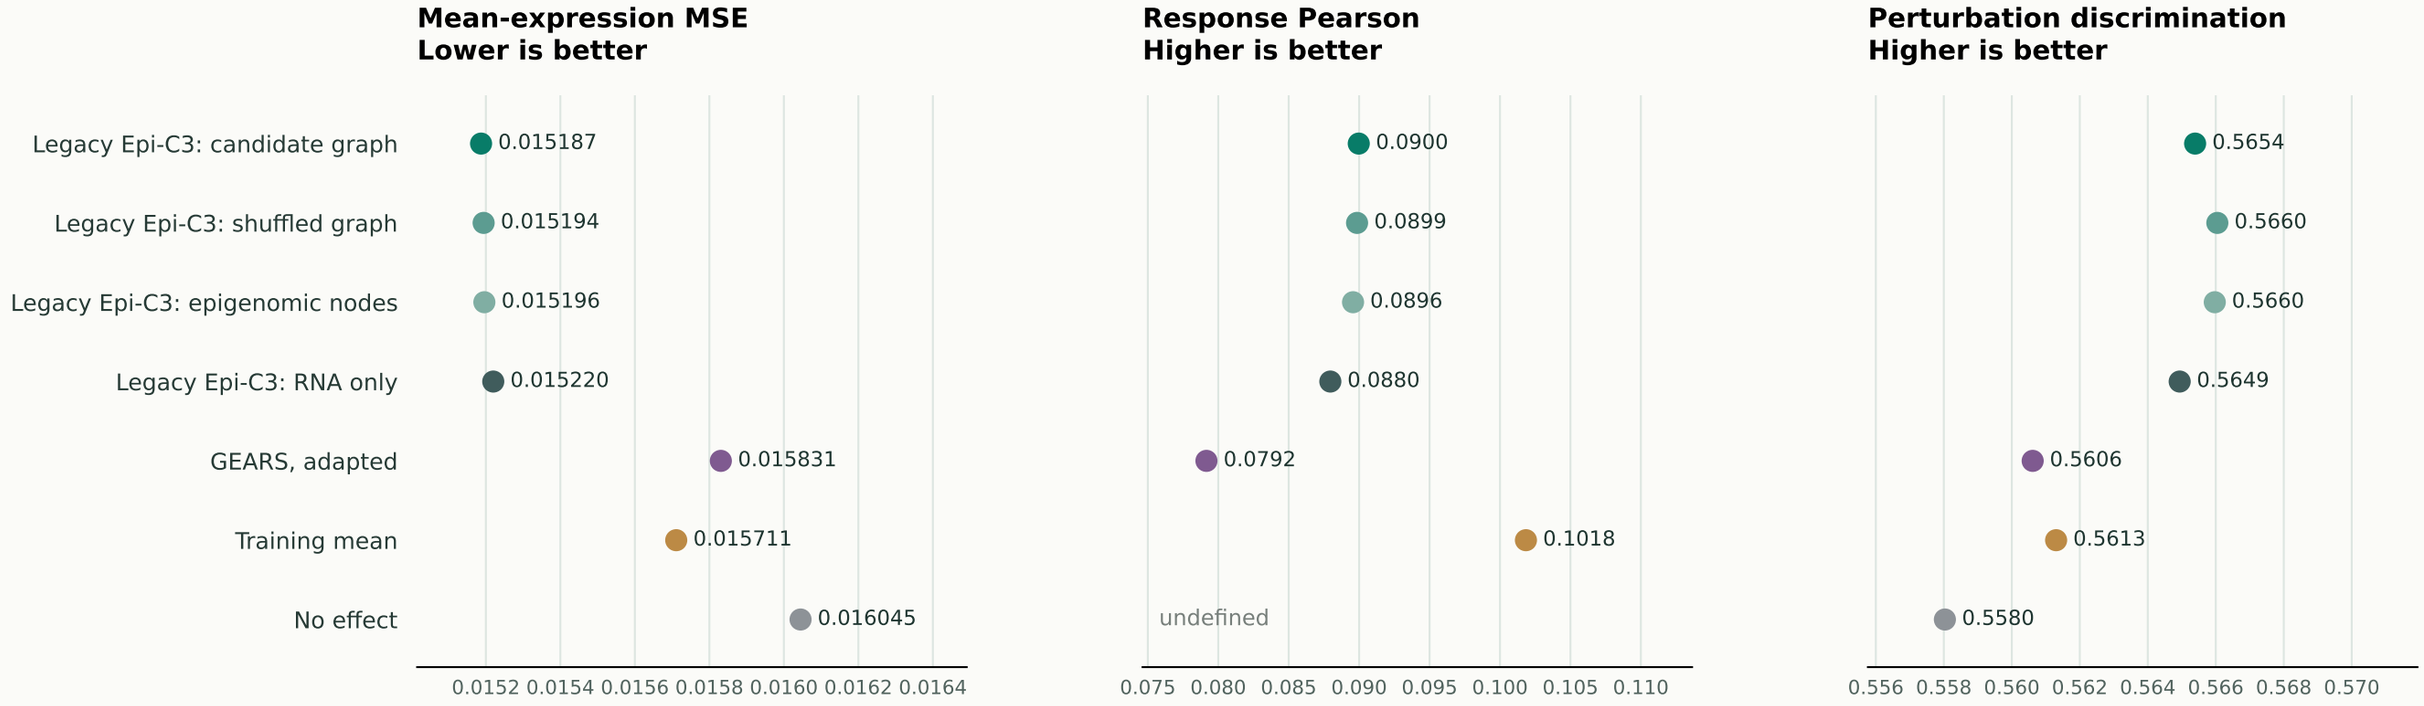
EPI-C3 / COMPARISON SNAPSHOT

Legacy K562: shared evaluation, not a STATE benchmark

Exploratory post-hoc analysis | 347 held-out targets | 1,860 non-target genes per target



NOT EVALUATED HERE: STATE, PerturbMean, ContextMean, Linear, scVI, CPA, scGPT architecture, and the two new Epi-C3 branches.

DE p-value AUPRC, log-fold-change correlation, DEG overlap and effect-size correlation: unavailable from saved means.

Single K562 context; previously examined test; GEARS has an additional GO prior and one seed. Epi-C3 has three response seeds sharing one encoder.

All scores are custom population-mean metrics, not official cell-eval scores. A constant predicted effect has undefined Pearson correlation.

Point estimates only: no independent biological replicate or confidence interval is claimed. Axis ranges are truncated; read numerical labels.
