Authors' saved STATE results: three datasets, six metrics

Reference only: not an Epi-C3 benchmark and not an exact reproduction of Cell Figure 2.

Bars: equal-weight context mean; whiskers: population SD across available contexts; dots: individual context means.

Parse has 3 matched contexts (CD4 Memory SE output missing); the paper's Figure 2 reports 4 splits.

PDS is the saved L1 field, not converted to the paper's normalized rank; CellEval versions can differ.

HVG and SE recipes differ. Other paper baselines and both new Epi-C3 models are not evaluated in this figure.
