a

Evaluation design

Source B and CD4 T cells: controls + treatments

Target CD8 T cells: input controls

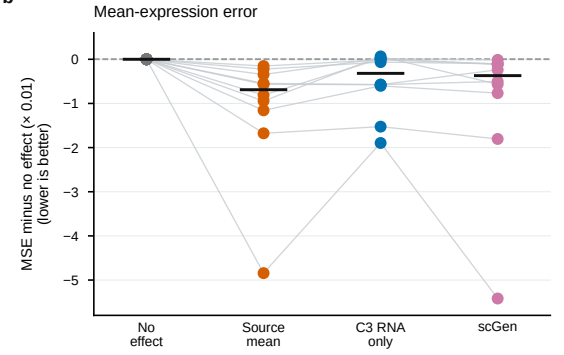
Four predictors: no effect, source mean, C3, scGen

Held-out target treatments: evaluation

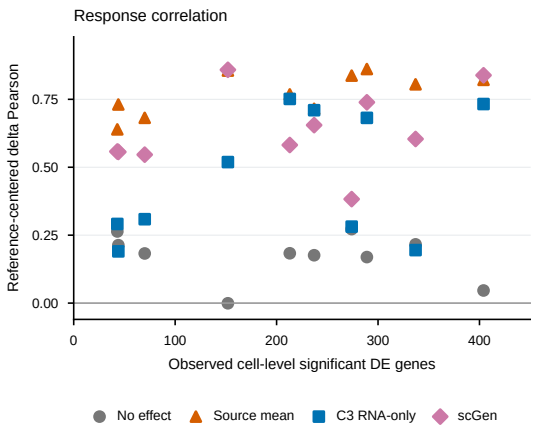
Separate target reference controls: evaluation

10 conditions; 5,000-gene source axis

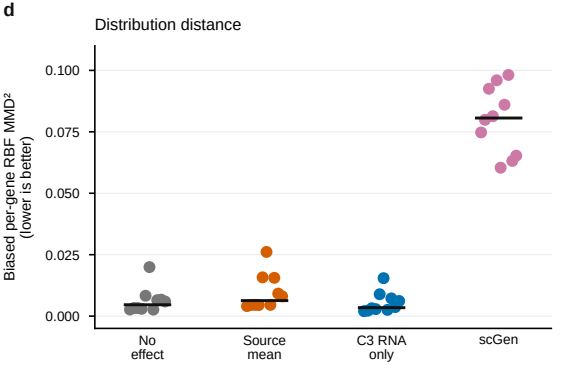
b



c



d



Each line joins one condition; black bars show medians. Points show individual conditions.

Input and reference controls differ; reference controls are reused across conditions.

No donor/batch matching; conditions are not independent biological replicates.

The 5,000-gene source axis may reflect held-out cells; cell-level DE is not replicate inference.

MMD uses at most 100 cells per group. Internal exploratory analysis, not an official score.
