a

Pilot setup

Representation: 1.62 M of 92.10 M planned rows

Flow: first 16 shards, 2,000 updates

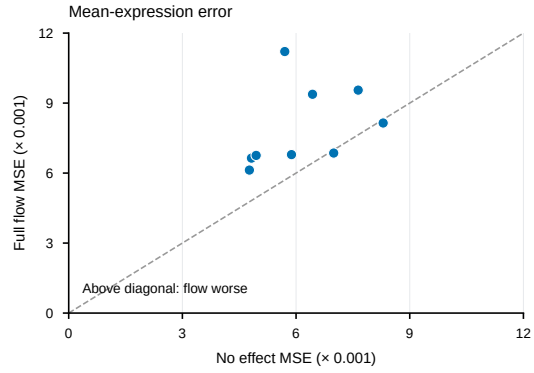
Evaluation: 9 drug conditions, 765 treated cells

Reference: 103 controls across 7 plates

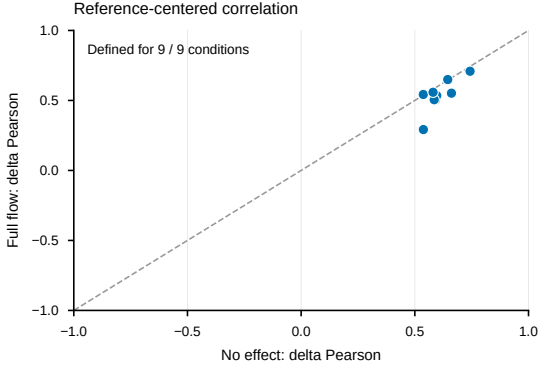
100 predictions per condition

11–20 distinct input controls per condition

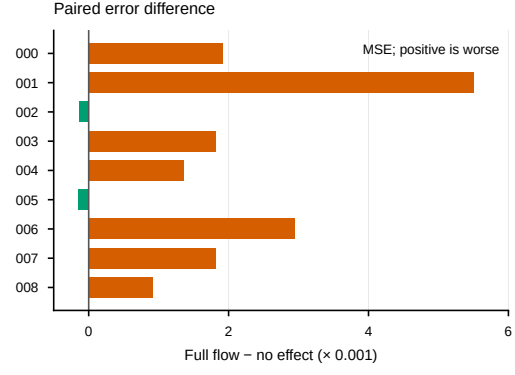
b



c



d



Each point or bar represents one drug condition; bar labels omit the compound- prefix.

MSE compares per-gene means of per-cell log1p(CPM 10,000).

Input controls are reused; conditions are not independent biological replicates.

Shared reference controls affect delta correlations; no epigenomic prior was used.

Partial-training, non-blind internal diagnostic; not an official challenge score.
